JORDAN WOOD

PUYALLUP, WA | (360) - 506 - 4598 | jordanwood159@gmail.com | LinkedIn | GitHub | Portfolio Website

PROFESSIONAL SUMMARY

Software engineer with a B.S. in Software Development and hands-on experience modernizing production systems. Migrated a government justice platform from AngularJS to Angular 13, improving code maintainability and reducing future development effort, and refactored asynchronous services to cut API response time. Builds full-stack applications with Java/Spring Boot, REST APIs, and relational databases, and component-based front ends in Angular, React, and TypeScript.

TECHNICAL SKILLS

- **Languages**: Java, Python, JavaScript, TypeScript, HTML5, CSS3, SQL
- **Frameworks/Tools**: Spring Boot, React.js, Angular 13, AngularJS, Node.js, RxJS, MySQL, PyTorch, Ollama, REST APIs, Git/GitHub, Bitbucket, Vite, Jira, Confluence
- **Concepts**: OOP, SDLC, Agile/Scrum, Component-Based Architecture, API Integration, MVC, Unit Testing, Data Structures & Algorithms, System Integration, LLM's, Generative AI, CUDA, Machine Learning
- **CI/CD & DevOps**: Jenkins, CI/CD Pipelines, Git, GitHub Actions, Docker, Linux, Bash/PowerShell

EMPLOYMENT HISTORY

Handshake AI **Jul 2026 - Present**
AI Trainer - Software Development *Remote*
- Developed and evaluated software engineering prompts to stress-test large language models, identifying failures in reasoning, logic, and code correctness.
- Audited and corrected model-generated responses, including Java and JavaScript code, writing detailed justifications that turned flawed outputs into high-quality training data.
- Improved AI performance on complex programming tasks through review and feedback, completing independent, deadline-driven work to project quality standards

Pierce County **Feb 2026 - Jul 2026**
Software Engineer Intern *Remote*
- Translated stakeholder requirements into a component-based architecture and migrated production AngularJS applications to Angular 13 using TypeScript and Angular CLI, delivering a more maintainable codebase and reducing future development effort, maintaining clear requirements-to-implementation traceability.
- Refactored asynchronous service logic and parallel data-fetching with RxJS, which reduced API response time and increased system reliability while improving integration with backend REST APIs.
- Debugged and resolved UI component and service-layer issues using Chrome DevTools and unit tests; collaborated with senior engineers through structured Bitbucket code reviews to consistently meet enterprise development standards.
- Developed and maintained software documentation and architectural patterns per established playbook conventions, supporting long-term maintainability and reducing onboarding friction for future developers.

Timberline Development, LLC **Apr 2021 - Dec 2023**
Manager *Puyallup, WA*
- Designed and built a JavaScript data-reconciliation tool that parsed JSON inventory records, applied matching logic against the store's in-house Excel manifest, and automatically flagged/corrected mismatches, reducing inventory discrepancies by more than 75%.
- Automated recurring data-entry and reporting workflows with custom scripts, eliminating about 40 hours of manual work per week.
- Diagnosed and resolved issues across the store's POS systems, network, and hardware, minimizing downtime for business-critical operations.
- Identified operational bottlenecks, designed and deployed automated Bash/PowerShell scripts, led a team up to 10, and streamlined financial reconciliation in a regulated environment, resulting in faster month-end closing and reduced manual errors.

PROJECTS

TinyGPT: Transformer Language Model | Python, PyTorch, CUDA | https://github.com/Jordan-360/tinygpt.git
- Built a 10.8M-parameter GPT-style transformer from scratch in Python and PyTorch, implementing tokenization, multi-head self-attention, and the full training loop following a nanoGPT approach.
- Trained the model on a 1.1M-character Shakespeare dataset with CUDA GPU acceleration in under 6 minutes, taking output from random characters to original, Shakespeare-style dialogue.

RAG-Powered Patch Notes Assistant | TypeScript, React, Node.js, Ollama | https://github.com/Jordan-360/patch-notes-assistant.git
- Built a full-stack retrieval-augmented generation (RAG) app that answers natural-language questions about Overwatch patch notes with cited sources, running local LLMs and embedding models via Ollama on a consumer GPU.
- Engineered the retrieval pipeline with structure-aware chunking, metadata filtering, and semantic vector search, and improved answer accuracy with prompt engineering, a unit-tested buff/nerf rules engine, and LLM failure fallbacks.

Job Application Tracker | React, TypeScript, Vite | https://jw-jobtracker.vercel.app
- Built a single-page React/TypeScript app with full CRUD functionality for managing job applications, with client-side persistence and JSON export/import for backup and portability.
- Engineered a reusable useLocalStorage custom hook in TypeScript to keep application state in sync with browser storage across sessions.

EDUCATION

BACHELOR'S OF SCIENCE (B.S.), SOFTWARE DEVELOPMENT **Sep 2021 - Mar 2025**
Grand Canyon University *Phoenix, AZ*

ASSOCIATE'S OF ARTS (A.A.), COMPUTER SCIENCE **Sep 2019 - Jun 2021**
Pierce Community College *Puyallup, WA*
