

JORDAN WOOD

PUYALLUP, WA | (360) - 506 - 4598 | jordanwood159@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio Website](#)

PROFESSIONAL SUMMARY

Entry-level Software Engineer with a B.S. in Software Development and production experience modernizing enterprise applications across the full development lifecycle in a government environment. Proficient in Java, TypeScript, SQL, and REST API design, with a strong foundation in OOP, system integration, component-driven architecture, and reliability-focused debugging. Experienced translating stakeholder requirements into maintainable, testable software and collaborating in Agile environments under structured code review.

TECHNICAL SKILLS

- **Languages:** Java, Python, JavaScript, TypeScript, HTML5, CSS3, SQL
- **Frameworks/Tools:** Spring Boot, React.js, Angular 13, AngularJS, RxJS, REST APIs, MySQL, Node.js, Git/GitHub, Bitbucket, Vite, Jira, Confluence
- **Concepts:** OOP, SDLC, Agile/Scrum, Component-Based Architecture, API Integration, MVC, Unit Testing, Data Structures & Algorithms, System Integration
- **CI/CD & DevOps:** Jenkins, CI/CD Pipelines, Git, GitHub Actions, Docker, Linux, Bash/PowerShell

EMPLOYMENT HISTORY

Pierce County

Software Engineer Intern

Feb 2026 - Present

Remote

- Translated stakeholder requirements into a component-based architecture and migrated production AngularJS applications to Angular 13 using TypeScript and Angular CLI, delivering a more maintainable codebase and reducing future development effort, maintaining clear requirements-to-implementation traceability.
- Refactored asynchronous service logic and parallel data-fetching with RxJS, which reduced API response time and increased system reliability while improving integration with backend REST APIs.
- Debugged and resolved UI component and service-layer issues using Chrome DevTools and unit tests; collaborated with senior engineers through structured Bitbucket code reviews to consistently meet enterprise development standards.
- Developed and maintained software documentation and architectural patterns per established playbook conventions, supporting long-term maintainability and reducing onboarding friction for future developers.

FusionTek

IT Support Intern

Jun 2024 - Sep 2024

Federal Way, WA

- Diagnosed and resolved hardware, software, and network issues across a multi-client MSP environment, applying structured troubleshooting methodologies to identify root causes and implement reliable solutions that reduced average resolution time.
- Managed and tracked incident tickets in Jira through defined escalation workflows, ensuring consistent process compliance and accurate documentation of resolutions to support team knowledge sharing.
- Provisioned and imaged devices for onboarding and refresh cycles, verifying consistent system configuration against established standards and minimizing operational downtime across client environments.

PROJECTS

Full-Stack Banking Application <https://github.com/Jordan-360/Full-StackBankingApplication.git>

- Translated application requirements into a layered Java (Spring Boot) architecture with RESTful service logic and database repositories, maintaining clear traceability from design through implementation across deposits, withdrawals, and transfers.
- Designed a relational MySQL schema with server-side validation to enforce data integrity and ensure secure, atomic financial operations, writing JUnit unit tests to validate core service-layer logic and verify expected behavior.
- Built responsive React dashboards integrating with backend REST APIs to display real-time account balances and transaction history, delivering a complete full-stack implementation across the entire software development lifecycle.

MLB Analytics Dashboard <https://github.com/Jordan-360/MLBAPI>

- Developed a multi-page vanilla JavaScript application consuming the MLB Stats API, implementing custom data parsing and dynamic UI rendering without reliance on frameworks.
- Integrated NewsAPI for live baseball news with pagination, applying asynchronous JavaScript patterns for reliable data fetching; built supporting Python scripts for data aggregation and preprocessing across multiple external API sources.

Flappy Bird Clone (JavaFX) <https://github.com/Jordan-360/FlappyBirdMockUp>

- Developed a fully playable 2D arcade game in Java using JavaFX, implementing a custom game loop from scratch to handle real-time player input, procedural obstacle generation, and dynamic score tracking without reliance on any external game engine.
- Implemented a physics-based movement system with collision detection and game state management, applying object-oriented design principles to keep rendering, input handling, and game logic cleanly organized within a single-class architecture.

EDUCATION

Grand Canyon University

BACHELOR'S OF SCIENCE (B.S.), SOFTWARE DEVELOPMENT

Sep 2021 - Mar 2025

Phoenix, AZ

- **Coursework:** Data Structures & Algorithms, Object-Oriented Programming · Web Development Fundamentals · Cloud Deployment & DevOps

Pierce Community College

ASSOCIATE'S OF ARTS (A.A.), COMPUTER SCIENCE

Sep 2019 - Jun 2021

Puyallup, WA

- **Coursework:** Data Structures & Algorithms · Computer Architecture · Operating Systems · Discrete Mathematics
